

Are you good enough for your patient?

Assessment and Certification of Laparoscopic Psychomotor Skills with LASTT method

Good surgeons deal with the specific skill requirements for laparoscopy. The new concept in education isolates the psychomotor skills from the surgical expertise and allows for testing and training outside of the operation room. Depth perception on 2-D video, remotely handling of instruments without tactile feedback, good hand-eye coordination and fine motor skills with long instruments are in the scope of the validated training method.

The European Academy of Gynaecological Surgery organizes training and certification for Laparoscopic Psychomotor Skills using the LASTT method. Go to www.theAcademyhouse.org for the list of workshops and venues. Online subscription possible.
